SN. 09/826,557   ATTORNEY DOCKET NO. CANO:023

IN THE CLAIMS

The status of the claims as presently amended is as follows:

1. (*Currently Amended*) A data communication apparatus comprising:

input means for inputting data;

designating means for designating a plurality of destinations for same data input by said input means, the plurality of destinations being destinations to which data are to be transmitted by respective different transmission methods;

transmitting means for transmitting the same data to the plurality of destinations designated by said designating means by the respective different transmission methods; and

managing means for managing information ~~related~~relating to ~~the~~ transmission made by said transmitting means by associating a same predetermined identifier ~~with each of the data input by said input means~~to each of the plurality of transmissions of the same data.

2. (*Original*) A data communication apparatus according to claim 1, further comprising display means for displaying a list based on the information managed by said managing means.

3. (*Currently Amended*) A data communication apparatus according to claim 1, wherein said transmitting means ~~is capable of transmitting~~transmits data using at least one ~~transmission method~~of E-mail and FTP (File Transfer protocol).

4. (*Original*) A data communication apparatus according to claim 1, further comprising a reader for reading images on originals and generating image data corresponding to the images, and wherein said input means inputs data from said reader.

5. (*Currently Amended*) A data communication apparatus according to claim 1, wherein said information includes items associated with the respective destinations, and said managing means ~~further manages the information related to the transmission by said transmitting means in a manner~~ discriminating said items ~~of the information~~ from each other according to the respective

different transmission methods.

6. (*Original*) A data communication apparatus according to claim 1, further comprising reception means for receiving instructions from a user.

7. (*Original*) A data communication apparatus according to claim 6, wherein said managing means is responsive to receiving an instruction for transmission interruption together with the identifier by said reception means, for interrupting transmissions to the plurality of destinations corresponding to the identifier.

8. (*Original*) A data communication apparatus according to claim 6, wherein said managing means is responsive to receiving an instruction for transmission interruption together with one of the respective different transmission methods by said reception means, for interrupting a transmission to one of the destinations that is associated with the one of the respective different transmission methods.

9. (*Original*) A data communication apparatus according to claim 6, wherein said managing means is responsive to receiving an instruction for changing of destination by said reception means, for changing one of the plurality of destinations for which the changing of destination was instructed.

10. (*Original*) A method of managing transmission reservations, comprising the steps of:
an input step of inputting data;
a designating step of designating a plurality of destinations for same data input by saidthe input step, the plurality of destinations being destinations to which data are to be transmitted by respective different transmission methods;
a transmitting step of transmitting the same data to the plurality of destinations designated by saidthe designating step by the respective different transmission methods; and

3

~~a managing step of~~managing information ~~related~~relating to the transmission made by ~~said~~the transmitting step by associating a same predetermined identifier ~~with each of the data input by said input step~~to each of the plurality of transmissions of the same data.

11. (*Currently Amended*) A method according to claim 10, further comprising a ~~display~~step of displaying a list based on the information managed by said managing step.

12. (*Currently Amended*) A method according to claim 10, wherein said transmitting step ~~is capable of transmitting~~transmits data using at least one ~~transmission method~~of E-mail and FTP (File Transfer Protocol).

13. (*Original*) A method according to claim 10, wherein said input step inputs data from a reader for reading images on originals and generating image data corresponding to the images.

14. (*Currently Amended*) A method according to claim 10, wherein said information includes items associated with the respective destinations, and said managing step ~~further comprises managing the information related to the transmission by said transmitting step in a manner~~ discriminating said items ~~of the information~~ from each other according to the respective different transmission methods.

15. (*Original*) A method according to claim 10, further comprising a reception step of receiving instructions from a user.

16. (*Original*) A method according to claim 15, wherein said managing step is responsive to receiving an instruction for transmission interruption together with the identifier by said reception step, for interrupting transmissions to the plurality of destinations corresponding to the identifier.

4

SN. 09/826,557   ATTORNEY DOCKET NO. CANO:023

17. (*Original*) A method according to claim 15, wherein said managing step is responsive to receiving an instruction for transmission interruption together with one of the respective different transmission methods by said reception step, for interrupting a transmission to one of the destinations that is associated with the one of the respective different transmission methods.

18. (*Original*) A method according to claim 15, wherein said managing step is responsive to receiving an instruction for changing of destination by said reception step, for changing one of the plurality of destinations for which the changing of destination was instructed.

19. (*Currently Amended*) A computer program executable by a computer for controlling a data communication apparatus, the computer program containing codes for:

    an input module for inputting data;

    a designating step of designating a plurality of destinations for same data input by saidresulting from the input codemodule, the plurality of destinations being destinations to which data are to be transmitted by respective different transmission methods;

    a transmitting module for transmitting the same data to the plurality of destinations designated by saidthe designating modulecode by the respective different transmission methods; and

    a managing module formanaging information relatedrelating to the transmission made by saidthe transmitting modulecode by associating a same predetermined identifier with each of the data input by said input moduleto each of the plurality of transmissions of the same data.
